IDENTIFIERS Pennsylvania

ABSTRACT

Pennsylvania's public school women administrators and their respective superintendents were surveyed by mailed questionnaires, which gathered information about their childhood, families, educational preparation, job recruitment, professional experiences, and future plans. The superintendents rated their work performance. Findings were compared with data from two earlier studies. Some of the administrators were interviewed. The study describes the women's positions and the barriers they successfully overcame to achieve these positions. Some findings are as follows: more younger women are entering administration, fewer are "single," more are combining career and family (but are having fewer children), more are publishing, and more are striving for higher level positions. ABSTRACT

Pennsylvania's public school women administrators and their respective superintendents were surveyed by mailed questionnaires. The women gave information about their childhoods, families, educational preparation, job recruitment, professional experiences, and future plans. The superintendents rated the women's work performance. Findings were compared with data from two earlier studies. Some women were interviewed. This study describes women currently holding administrative positions and how these women were able to overcome successfully the barriers to achieving administrative positions.

Women Administrators in Pennsylvania's Public Schools:
Profiles, Problems, and Pleasures

Only a limited number of women are presently employed as school administrators in the state of Pennsylvania or in the United States. In fact during the 1981-82 school year, women were less likely to be found as school principals in Pennsylvania (9%) than in the United States as a whole (16%). In 1977, 40% of the secondary teachers and only 2.8% of the secondary principals in Pennsylvania were female while the national average for female secondary principals was 7%. In 1978, 77% of the elementary teachers and 12.4% of the elementary principals in Pennsylvania were female while the national average for female elementary principals was 18%. Except for a change in percent of elementary female principals to 13.0%, these figures remained almost the same in 1981 for Pennsylvania. The number and percentage of women principals both elementary and secondary declined between 1970 and 1981 in Pennsylvania.

For the first time in recent years, the percent of women employed as superintendents (1.7%) and assistant superintendents (9.1%) in Pennsylvania resembled the national averages of 1.8% and 9% respectively. In terms of numbers, Pennsylvania accounted for 25 of the 721 female superintendents and assistant superintendents in the United States for the school year 1981-82. See Table 1 for additional data.

The purpose of this study was to determine the current status of women administrators in the public schools of Pennsylvania. Answers to the following questions were sought. What personal background factors have influenced these women to become educational administrators? Have these women experienced barriers in their climb to administrative positions? If so, what have the barriers been, and how did the women deal with them? In order to answer these questions, the childhood background, current family situation, educational preparation, professional experience, and future personal and professional plans of the women were studied. Findings were compared with data from

two earlier Pennsylvania studies (Zimmerman, 1971; Smith, 1976). A professional evaluation of these women in their current positions was sought from the superintendents of the school districts where the women were employed. An answer was sought to the following question. "Are these women outstanding, exceptional administrators?"

Method

Population

All women holding public school administrative positions in the state of Pennsylvania during the Spring of 1981 were surveyed via a mailed questionnaire. The following positions were considered as administrative jobs: superintendent, assistant superintendent, administrative assistant, assistant executive director, principal, and assistant principal. Supervisory positions were not included in the study. At that time 386 women held the positions designated as administrative and 62.4% of the women (241) returned the questionnaires. An adequate proportion of women in each role category, in varying size and district location responded to provide information from all the varied sections of the state. (Table 2). Central office positions were held by 23.7%, secondary by 29.9%, and the remaining 46.5% were elementary school administrators. Principalships were held by 52.3% of the women and vice-principalships by 24.1%. (Table 4). The superintendents of these women were also surveyed and 74.1% completed the work performance questionnaire.

Procedure

The women received an 8 page, 60 item questionnaire which included many items needing written responses rather than checking off responses from a list. The questions were those used in the Smith and Zimmerman studies (each used a different survey), items from other questionnaires, and additional questions of interest. This survey was then pilot tested on women administrators who were

to be a part of the survey. Follow-up interviews with a random sample of 20 of the women conducted after the survey demonstrated the stability of the written answers as the oral responses did not vary from the written answers.

The Superintendent's rating form was a shortened version of the SMART instrument (Stefanski, 1978) which requested ranking for individual work areas and concluded with an overall performance rating on a scale of 1 (low) to 10 (high). Only the overall rating was used in this study.

Results

Personal Data

Most of the women were first-born children from two-sibling families with parents who had encouraged their daughters to seek higher education. During childhood and in the teenage years, the majority of the women had had close and warm relationships with their parents, especially with their mothers. Play activities engaged in most often were outdoor activities, reading, and playing school. The women ranged in age from 29 to 66 years with the average age being 48 years. Eighty-seven per cent of the women were white. (Table 5). Seventy-four per cent of the women had been married but, at the time of the study only 55% were married. Fifty-nine per cent of the women reported having had children with the average number of children per woman 1.6. Since 71% of the women had no children under 17 at the time of the study, there was little need for child care arrangements.

One-third of the women had household help for an average of 6 hours per week. Most of the women reported working 10 to 15 hours per week themselves on household duties. Two-thirds of the married women reported strong approval of their work by their spouses. If their spouses had not approved, they had most often been dealt with through discussion, insistence on the right to a career, or balance of job and home responsibilities by the woman. If their spouses would be transferred beyond commuting distance, the majority would not quit their positions

immediately in order to follow their husbands. Most women indicated job mobility within 150 mile radius of their present homes. Home ownership was listed most often as a factor which contributed to limited mobility.

Educational Preparation

Most of the women in the study had earned a master's degree, usually in educational administration. Fifty-one had earned Certificates of Advanced Graduate Study and 50 had earned their doctorates. Compared with the women who were over 60 years old, 6 times as many in the under 30 age group had earned their doctorates. Half of the women who held doctorates were in central office positions. (Table 3). At the time of the study 37 women were involved in a degree program; 34 of these working for doctorates. Two hundred and five of the women reported holding principal's certificates, 56 had supervisory certificates, and 55 had superintendent's letters of eligibility from Pennsylvania, 18 other states, and the District of Columbia. Approximately one-quarter of the women had had books or articles published and of these, 40% had published more than two.

Job Recruitment

The women had most often become interested in educational administration because they wanted a stronger role in education. The most often cited source of encouragement to enter administration had been "Myself." Administrative superiors had been the group that had most often discouraged the women from entering administration; however, more women reported no discouragement at all.

In trying to locate administrative positions, the women most frequently used information from administrators. For 84% of the women, the first administrative position had been in the district where they were employed at the time. One-third of the women had obtained their present position by being selected in advance of applying and another one-third had received their present position by applying for

a vacancy in the district where they had been working. One or less applications were generally submitted before being offered their first and their present positions. Over half of the women had had only one interview while 11% had never had a job interview.

About one-fifth of the women had experienced difficulty in obtaining administrative positions. Of this group, nearly one-half felt the cause of the difficulty was prejudice against women. In trying to solve this difficulty, the women had used a total of 10 different kinds of solutions. The solution used most frequently had been perseverance with increasing geographical distance in which to look for positions and seeking the help of superiors was cited next most frequently.

Professional Experiences

No pattern was noted as to the age when the women decided on a career in education or in administration. Most of the women received their first educational position when 21 years old and their first administration position had been attained between the ages of 21 and 56. The position of classroom teacher had been held longer than any other educational position. The administrative positions held most often had been principal and vice-principal. Women secondary principals tended to be younger and to advance more rapidly than women elementary principals or central office administrators.

Most of the women had worked in only one district as an administrator, but the districts varied in size and setting including urban, suburban, and rural. During the 1980-1981 school year, the average salary was \$30,215.78. Not quite 50% had earned over \$30,000 for the year and 5% had earned over \$40,000. Three-quarters of the women had been absent three or less days during the 1979-1980 school year. Less than 50% of the women had taken leaves of absence averaging

about 12 months; only 14% had taken maternity or child care leave. Over 90% of the women cited a feeling of self-satisfaction and accomplishment as their greatest career reward.

The greatest obstacle experienced in seeking a career had been that of time scheduling with financial problems, pressures of child rearing, and prejudice listed next. Two solutions, maintaining a professional attitude and adjusting time schedule, had been used overwhelmingly by the women to overcome these obstacles. (Table 6). The problem of job and home conflicts had been experienced most often in present and previous administrative positions followed by lack of acceptance in male administrative social situations, and third had been resentment from subordinates. In dealing with problems on the job, the women most frequently had maintained a professional attitude as a solution and the next highest response was an indication that the problem had not been resolved. (Table 7). In general, relationships with fellow workers were characterized as cordial. If the women had found negative co-workers, they most often had dealt with those workers by maintaining a professional attitude or by doing their own jobs well. Three-quarters of the women had found their communities to be accepting of a female administrator. If not, the women most frequently had dealt with the nonacceptance by increased community contact.

Future Plans

The position listed most often as an ultimate career goal was the principal. Almost one-half of the women listed goals which indicated upward mobility. Some of the women had already reached their ultimate goal: 25% of the central office women, 16% of the secondary principals, and 49% of the elementary principals. Retirement was planned between the ages of 60 and 65. In searching for new positions, the women most often would rely on advertisements in journals and newspapers.

When asked about personal plans for the next two years, 39% of the women who responded stated that they would look for new positions. Another one-third planned sabbatical leaves for study or travel. If they anticipated problems in dealing with future plans, the women would most often change to a more reasonable plan or seek additional training to solve the problem.

Superintendents' Ratings

On a scale of 1 (low) to 10 (high), over two-thirds of the superintendents rated their women administrators 8 or above on work performance. Only 4% gave their women administrators a rating lower than 5. Clearly, the superintendents felt that the majority of the women were in the superior category.

Comparisons with Earlier Studies

Pennsylvania women school administrators were surveyed in June 1970 by Zimmerman, in November 1975 by Smith, and in April 1981 by Rometo. Zimmerman included women from districts which ranged in size from 6,000 to 100,000 students while the other two studies included all school districts in the state. Smith and Rometo both surveyed women principals and vice principals in elementary and secondary schools. Zimmerman's study included both administrators and supervisors who were part of the superintendent's immediate and extended teams. Rometo's study was limited to those administrative positions with the following titles: superintendent, assistant superintendent, administrative assistant, assistant executive director, business manager, principal, and vice principal. Women with supervisory positions were excluded from the study (which in 1981 were approximately 50% of all central office positions). This accounts for the large difference between the numbers of central office women in the Zimmerman and Rometo studies.

The following trends as noted in Table 8 were discovered regarding a comparison of the women in this study with those in Zimmerman's and Smith's

studies. More younger women entering administration. Less women in the "single, never married" category, more women appeared to be combining family and career. On the average, the number of children the women have is decreasing. Fewer women are getting bachelor's degrees in elementary education, while more are majoring in educational administration when seeking master's degrees and doctorates. More women are publishing. Women administrators are working in a greater number of districts. Salaries are much higher which probably reflect the dates of the studies. Most women in all three studies had been absent no more than 5 days per year. Fewer are taking maternity/child care leaves and more are taking study leaves. More women are striving for higher level positions.

Discussion

These studies attempted to cover so many issues that it is necessary to step back and review the major factors. What is the profile of the woman Pennsylvania school administrator in 1981? What are her problems and her pleasures?

Profile

She is white, first-born, and presently married with two children now grown. Encouragement has come from her parents, her spouse, and herself rather than from mentors. She had worked in only one suburban or urban district receiving superior work ratings from her superintendent, and had a very low absentee and leave rate. Job mobility is limited by home ownership to 150 miles. More of the younger women had doctorates in educational administration and more secondary than elementary principals were seeking advancement.

Problems

Barriers most often reported were discrimination against women, lack of administrative openings, time scheduling, financial problems, job/home conflict; lack of acceptance in male social administrative situations, resentment from subordinates and peers, and feminine role as follower expected. Solutions reported as most often used or planned for barriers were perseverance, increasing

geographical search area, help from spouses and superiors, maintaining professional attitude, time schedule adjustment, low-keyed interaction, switching to more reasonable plan, or not resolved.

Pleasures

She is more likely to be aspiring upward than women administrators five and ten years ago. She is attempting to pursue both family and career. She is entering administration at a younger age, usually with advanced work in educational administration or is taking a study leave for that purpose. She is more likely to have published. She became interested in educational administration because she believed the position important, wanted a stronger role in education which would provide a better opportunity for service, and enjoyed leadership. Her perserverance paid off.

Recommendations

Women desiring to be educational administrators should be prepared to deal with perceived or actual discrimination. They should make administrators within their own districts aware of their interest. Women usually do not find mentors to sponsor them, but are able to get needed job information from other administrators. They should not be discouraged if they experience many failures or rejections in the process of searching for a new position; they should persist.

School districts searching for administrators to fill post should seriously consider qualified women applicants. School districts in the hiring process should be certain that their job descriptions, verbal images of possible candidates, and language usage do not reflect a "male only" attitude. Administrators, especially superintendents, in districts where women are working as administrators, should be careful not to exclude these women from administrative activities, both daily and special social happenings.
